## Research Experience

### • Datacenter and System Taxes Reduction

2023 – Present

*Intel Labs*

The concept of the “datacenter and systems taxes” refer to a set of shared low-level software components that consume a significant portion of processor cycles in warehouse-scale computers (WSCs) and distributed systems. We have been conducting various hardware and software innovations to reduce such taxes. The results have been published in **ISCA'24**, **ASPLOS'24**, **OCP 2023 Global Summit**, and **USENIX ATC'23**, and have been transferred to Intel (future) products.

### • Embracing Emerging CXL devices in Modern Datacenter

2022 – Present

*Intel Labs*

CXL has been attracting much attention as the next generation of device interconnect standard, providing unique features such as memory expansion and cache coherence. **As the pioneer of this direction**, we have been exploring CXL memory devices (**Type 3**) and CXL accelerators (**Type 2**) based on real commodity hardware from different aspects, including both hardware functions enhancements and system software optimizations. The results have been published in **OSDI'24**, **VLDB'24**, **MICRO'23** and **OCP 2023 Global Summit**.

### • Accelerator Design for Network/Application Dataplane Operations

2018 – 2023

*UIUC and Intel Labs*

Tackling the modern data explosion and the “killer microsecond” problem in datacenters, we design accelerator architecture, programming models, and integration schemes to accelerate a wide range of fine-grained but costly operations in datacenter’s software stacks and applications. The results have been published in **HPCA'23**, **HPCA'21** and **ISCA'19**.

### • I/O Subsystem Design and Optimization for Modern Server CPU

2018 – 2021

*UIUC and Intel Labs*

High-speed I/O devices can exert significant pressure on the CPU’s cache/memory system. We study the I/O-host interaction behavior in the real system, and build realistic and accurate I/O subsystem models for gem5 simulator. We also propose multiple solutions in both real systems and simulation models to optimize the data transfer, notification, and interference in the I/O subsystem. The results have been published in **CAL'23**, **MICRO'22**, **ISCA'21** and **ISPASS'20**.

### • In-network Computing for Distributed ML Training Acceleration

2017 – 2021

*UIUC and Microsoft Research*

Distributed ML training is notoriously time- and resource-consuming. We propose to leverage the networking devices, including NICs (for in-network gradient compression) and switches (for in-network gradient aggregation), to facilitate the inter-machine communication, which is the most expensive portion in distributed training. We also explore the new potential for P4 programmable switch to process more complicated (floating-point) operations. The results have been published in **NSDI'22**, **ISCA'19**, and **MICRO'18**.
